TITLE OF INVENTION: Multiple Data Rate Hybrid Walsh Codes

for CDMA

INVENTORS: Urbain A. von der Embse

CLAIMS

WHAT IS CLAIMED IS:

Claim 1. (cancelled)

Claim 2. (cancelled)

Claim 3. (cancelled)

Claim 4. (cancelled)

Claim 5. (currently amended) A method for the generation of design and implementation of fast encoders and fast decoders for Hybrid Walsh and generalized Hybrid hybrid Walsh complex orthogonal codes for CDMA, -channelization codes for multiple data rate users over said method comprising the steps: a frequency band with properties classify the N=2^M N-chip Walsh codes into even codes and odd codes according to their even and odd properties about their code centers for integer M, said Walsh codes by definition are the {+1,-1} valued N orthogonal Hadamard codes re-ordered according to their sequency values where sequency is the average rate of phase changes over each N chip code length, classify the N N-sample discrete real Fourier transform codes into even codes and odd codes and re-order said codes according to increasing frequency, construct a one-to-one correspondence of said N real Walsh codes

with said N real Fourier transform codes such that sequency corresponds to frequency, even codes correspond to even codes, and odd codes correspond to odd codes,

construct a mapping which uses said N real Fourier codes for the real and imaginary axis codes of the N N-sample discrete complex Fourier transform (DFT) codes and,

for c = 0,
$$\widetilde{W}(c) = W(0) + jW(0)$$
,

for c = 1,2,...,N/2-1, $\widetilde{W}(c) = W(2c) + jW(2c-1)$,

for c = N/2, $\widetilde{W}(c) = W(N-1) + jW(N-1)$, and

for c = N/2+1,...,N-1, $\widetilde{W}(c) = W(2N-2c-1) + jW(2N-2c)$.

Hybrid Walsh inphase (real axis) codes and quadrature (imaginary axis) codes are defined by lexicographic reordering permutations of the Walsh code

Hybrid Walsh codes take values {1+j, -1+j, -1-j, 1-j} or equivalently take values {1, j, -1, -j} with a (-45) rotation of axes and a renormalization

generalized Hybrid Walsh codes can be constructed for a wide range of code lengths by combining Hybrid Walsh with DFT (discrete Fourier transform), Hadamard and other orthogonal

codes, and quasi-orthogonal PN codes using tensor product, direct product, and functional combining fast encoding and fast decoding implementation algorithms are defined algorithms are defined to map multiple data rate user data symbols onto the code input data symbol vector for fast encoding and the inverses of these algorithms are defined for recovery of the data symbols with fast decoding encoders perform complex multiply encoding of complex data to replace the current Walsh real multiply encoding of inphase and quadrature data decoders perform complex conjugate transpose multiply decoding of complex data to replace the current Walsh real multiply decoding of inphase and quadrature data Claim 6. (currently amended) A method for the generation of design and implementation of encoders and decoders for complex orthogonal CDMA and generalized hybrid Walsh codes for CDMA from code sets which include said hybrid Walsh, said Hadamard, said and pseudo-noise PN, said method Walsh, said DFT, comprising: complex orthogonal CDMA channelization codes for multiple data rate users over a frequency band with properties tensor product also called Kronecker product is used to construct said codes, direct product is used to construct said codes,

combinations of tensor products, direct products, and functional

functional combining is to construct said codes and,

combining are used to construct said codes.

complex codes inphase (real axis) codes and quadrature (imaginary axis) codes are defined by reordering permutations of the real Walsh codes

generalized complex codes can be constructed for a wide range of code lengths by combining the complex codes with DFT (discrete Fourier transform), Hybrid Walsh, Hadamard and other orthogonal codes, and quasi-orthogonal PN codes using tensor product, direct product, and functional combining

fast encoding and fast decoding implementation algorithms
are defined

algorithms are defined to map multiple data rate user data symbols onto the code input data symbol vector for fast encoding and the inverses of these algorithms are defined for recovery of the data symbols with fast decoding

encoders perform complex multiply encoding of complex data to replace the current Walsh real multiply encoding of inphase and quadrature data

decoders perform complex conjugate transpose multiply decoding of complex data to replace the current Walsh real multiply decoding of inphase and quadrature data

Claim 7. (currently amended) A method for mapping multiple data rate user symbols onto the code vectors of said codes in claime 5 and 6, said method comprising the steps:

assign said users with like data symbol rates to the M groups

- u_{M-1}, u_{M-2}, . . . , u₁, u₀ of users with the respective symbol rates 1/NT,2/NT, . . .,2/T in units of data symbols per second where N=2^M is the number of code chips in said code block, and number of N-chip length codes, and number of user data symbols, M is the number of said user groups and said code rates in said menu, 1/T is the code chip rate in chips per second,
- in said assignment said lowest available symbol rate 1/NT

 user requires 1 N-chip code to support the data rate, said

 2/NT user requires 2 N-chip codes, . . ., and said 2/T

 user requires N/2 N-chip codes,
- generate the N data symbol index d=d₀+2d₁+4d₂+...+ (N/2)d_{M-1} and partition said data symbol index into M fields d_{M-1}, d_{M-2}d_{M-1}, ..., d₁d₂····d_{M-2}d_{M-1}, d₀d₁d₂····d_{M-2}d_{M-1} which fields respectively are indexed over the available number 2,4,...

 ., N/2,N of data rate users for each data symbol rate in the menu 1/2T,1/4T,...,1/NT symbols per second respectively,
- assign said data symbol indices in field d_{M-1} to said users in said group u_{M-1} , assign said data symbol indices in field $d_{M-2}d_{M-1}$ to said users in said group u_{M-2} , . . ., assign said data symbol indices in field $d_1d_2\cdots d_{M-2}d_{M-1}$ to said users in said group u_1 , and finally assign said data symbol indices in field $d_0d_1d_2\cdots d_{M-2}d_{M-1}$ to said users in said group u_1 ,
- assign said data symbol index $d=d_0+2d_1+4d_2+...+(N/2)d_{M-1}$ to said N-chip code vectors and,
- said assignments define the mapping of said user symbols for data rates from said menu 1/NT,2/NT,...,2/T symbols per second onto said N-chip code vectors.
- Claim 8. (currently amended) Wherein said hybrid Walsh codes in claims 5 have a fast encoding algorithm, comprising the steps:

```
use said index fields in claim 7 to arrange the input
      data symbol set in the format Z(d_0, d_1, \ldots, d_{M-2}, d_{M-1})
     corresponding to said d=d_0+2d_1+4d_2+...+(N/2)d_{M-1}
implement pass 1 of said fast encoding algorithm by multiplying
      said Z by the kernal [(-1)^d_{n_{M-1}}+j(-1)^d_{n_{M-1}}] and summing
      over dr_0, di_0=0, 1 to yield the partially encoded symbol set
      Z(n_{M-1}, d_1, \ldots, d_{M-2}, d_{M-1}) where dr_0=cr(d_0) and cr(d) is the
      real axis code for d, di_0=ci(d_0) where ci(d) is the
      imaginary axis code for d, and n_{M-1} is a binary code chip
      coefficient in said code chip indexing n = n_0 + 2n_1 + ...
      +(N/4) n_{M-2}+(N/2) n_{M-1}
implement passes m=2,3,...,M-1 of said fast encoding algorithm
     by multiplying
      Z(n_{M-1}, n_{M-2}, \dots, n_{M-m+1}, d_{m-1}, \dots, d_{M-2}, d_{M-1}) by the kernal
    [(-1)^d r_{m-1} (n_{M-m} + n_{M-m+1}) + j(-1)^d i_{m-1} (n_{M-m} + n_{M-m+1})] and summing
     over dr_{m-1}, di_{m-1}=0, 1 to yield the partially encoded symbol
      set Z(n_{M-1}, n_{M-1}, n_{M-2}, \dots, n_{M-m}, d_{m}, \dots, d_{M-2}, d_{M-1}),
implement pass M of said fast encoding algorithm by
      by multiplying Z(n_{M-1}, n_{M-2}, \dots, n_2, n_1, d_{M-1}) by the kernal
     [(-1)^dr_{M-1}(n_0 + n_1) + j(-1)^di_{M-1}(n_0 + n_1)] and summing over
     dr_{M-1}, di_{M-1}=0, 1 to yield the encoded symbol set
      Z(n_{M-1}, n_{M-1}, n_{M-2}, \dots, n_2, n_1, n_0), and
reorder the encoded symbol set in the ordered output
      format Z(n_0, n_1, \ldots, n_{M-2}, n_{M-1}).
      Claim 9. (currently amended) Wherein said hybrid Walsh
codes in claims 5 have a fast decoding algorithm, comprising the
steps:
implement pass 1 of said fast decoding algorithm by multiplying
      said Z(n_0, n_1, \dots, n_{M-2}, n_{M-1}) from claim 8 by the kernal
      [(-1)^n_0dr_{M-1}+j(-1)^n_0di_{M-1}] and summing over n_0=0,1 to yield
      the partially decoded symbol set
```

implement passes m=2,3,...,M-1 of said fast decoding algorithm

 $Z(d_{M-1}, n_1, \dots, n_{M-2}, n_{M-1}),$

```
